Ceramic grains structure

The self-sharpening properties of the ceramic grains' structure provide maximum durability and fast stock removal rates.

Special open coating

The ceramic grain properties combined, with the open stearate surface structure, optimises the lifespan and the efficiency of the product.

A black and white photograph showing a group of approximately ten people from the waist up. They are all wearing similar protective equipment: dark t-shirts, dark trousers, and light-colored respirators or face masks. Some individuals also have dark goggles resting on their foreheads. They are standing in a slightly staggered line, looking directly at the camera with serious expressions.

EX1800	PAINT STOP EXHAUST FILTER	1800MM X 25MTR

CONCERTINA FILTER

The best range of inertia separation filters on the market. High loading capacity, easy to ship, easy to store, high efficient filters.

The migration phenomenon is common when slow drying coatings are used in combination with mesh or fiberglass filters. This happens when the airflow pulls out particles previously trapped in the mesh or fiberglass. Consequently, the once deposited particles will again migrate throughout the system. However, with the Andreae Filter Separation by Inertia principle, the paint particles stay trapped in the retention pocket outside of the airstream.

Often copied, never equaled!
